Project Description:

- This project is under the Carbon Capture, Utilization and Storage Technology Center of Excellence within the Energy Consortium at IIT Madras.
- Utilization of the emitted CO₂ as a chemical feedstock not only serves the purpose of producing fuels and various platform chemicals but also in enabling a circular economy. One such means of utilizing CO₂ as a feedstock is by catalytic reduction with H₂ to value-added chemicals like methanol or other alcohols, or long-chain hydrocarbons. Typical synthesis of methanol and hydrocarbons from CO₂ is carried out from a mixture of CO/CO₂/H₂ at a high temperature and pressure using multicomponent catalysts. Understanding reaction kinetics and catalyst structure - property relations are crucial in optimizing these reactions for commercial development.

Job Scope:

- The job scope for this position will include (but not restricted to) survey and summarising of the literature, timely purchase of chemicals and components for the experiments, assembling of the reactor set up and online gas sampling systems, systematic planning and execution of synthesis and detailed characterization of catalysts, fixed bed catalytic reactor experiments of the CO₂ reduction to methanol and hydrocarbons under varying conditions using these catalysts, data recording, analysis and reporting, contributing to scientific communication in the form of journal articles, technical reports and so on.
